WBU5 Series Key Features:

- Horizontal assembly corresponds to the operation flow design of the PC boards for handy operation
- Round hole design makes the electric connection better
- Formed with V-shaped cross-sectional groove, which allows DIP IC pins to be inserted across two parts and to increase the rate of utilization due to small pitch
- Dovetail protrusions and recesses designed to connect two adjacent parts tightly together

JE Series Key Features:

- Use to breadboard and debug circuit designs
- Low static, plastic body – CMOS safe
- Nickel-plated clips designed to withstand up to 5,000 insertion cycles
- Breadboard strips connect together to form larger working areas
- Components are easily interconnected using 20-28 AWG wire (P/N 19289 & 20079, below)
- Some models feature heavy-duty aluminum backings (JE24, JE27, WBU504)

The Basics of PC-Based Data Acquisition, Analysis, and Control

Using your PC as a platform for the acquisition, analysis and control of physical data is both powerful and economical. Simply adding a card with analog and digital data acquisition and control capability, along with easy-to-use software, turns your desktop or laptop computer into a sophisticated instrumentation system.

PC-based data acquisition and control system is comprised of five fundamental elements:

sensors/transducers, analog-to-digital conversion with signal conditioning, digital sensing, analog and/or digital control, and

software. The first consideration is the physical parameter or condition you wish to measure and record;

it could be temperature, pressure, acceleration, vibration, sound intensity, and much more. Transducers convert physical parameters to electrical signals. Many transducers require signal conditioning (amplification, filtering, etc.), which is usually provided by the data acquisition card.

**See Sensors
On Page 41**

For most PC-based data acquisition systems, analog-to-digital conversion is typically handled with a plug-in board or card - commonly known as DAQ boards (PCI or ISA type). The key function of a

Universal Library Graphical Programming for Visual Basic

194010: The Universal Library is a library of 65+ syntax commands in different programming languages. The library provides these commands plus the syntax format in its respective language.

194044/194036/194028: SoftWIRE is a graphical programming package for Visual Basic; one window holds the graphical program while the other holds the user interface on a Visual Basic form. By simply using the 130+ functions included with the software, you can click on the function, make connections to the controls with wires, provide your options, then run the program. While you are creating all these functions and connections, the software also provides the code in Visual Basic.

System requirements: PC with Pentium® 90 or higher; Windows® 95/98/2000/ME/NT4.0; Microsoft® Visual Basic 6.0 or later; VGA or higher resolution monitor; any Measurement Computing DAQ or GPIB board

Part No.	Description	1	5
194010	Universal Library	\$48.95	\$43.95
194044	SoftWIRE4/VB-Student	48.95	43.95
194036	SoftWIRE/VB-1YR	197.95	177.95
194028	SoftWIRE/VB-PPD	493.95	443.95

DAQ board is to convert the analog signals coming in from the sensors into digital signals with which the PC can deal. The primary specifications to look for are number of channels, resolution, and sample rate.

Virtually all DAQ boards also have the capability of sensing digital input signals; for example, switch contacts. These signals are often used to initiate acquisition of analog data.

Once the data has been acquired and processed by the PC, the analog and digital output capability of a DAQ board can be used for control; i.e., "closing the loop".

A popular software program, SoftWIRE, is built in two windows. The first window holds the graphical program while the other window holds the user interface on a Visual Basic form.

What is An H8 Data Logger?

An H8 data logger is a small battery-operated electronic instrument that measures and records physical parameters over time such as temperature, humidity, light intensity over time any physical value represented by a DC voltage. They are equipped with a microprocessor, data storage, and sensor. Some models allow the use of external sensors.

The data logger is connected to a personal computer (cable supplied) and the turn-key software is used to select logging parameters such as sampling intervals and sampling period. Start time is also programmed and determines when the logging is initiated. The data logger is then disconnected from the PC and deployed in the desired location.

Used mainly in remote areas or anywhere the convenience of battery power to record measurements is wanted, they are ideal for those involved with field studies, transportation monitoring, HVAC, troubleshooting, quality studies, general research, and educational science.

Examples of typical applications are: deployed in Alaskan glaciers in the hopes of finding answers to the global warming concerns; used by Cascade Designs, makers of Thermo-Rest® sleeping bags, to determine thermal comfort ratings of their outdoor products; the state of Kansas used the data loggers for fuel savings evaluations in residential homes; helps to improve the performance of radio controlled race cars; and manage many aspects of a Laundromat business.

4-Port RS-232 Smart Switch/Port Combiner

Often called "line sharers" or "code activated switches" this smart switch can be used to connect one RS-232 port to four or more different serial devices. This switch can be controlled in two ways: 1) referred to as "smart switch mode", the switch is controlled by sending a preamble (usually three characters) to the master port. One character of the preamble code is user programmable by internal switch setting.; 2) referred to as "port combiner mode", a slave port can gain access to the master port by asserting a handshake line (RTS for DTE slave ports, CTE for DCE slave ports).

- Supports TD, RD, RTS, and CTS
- Baud rates from 1200 to 115.2kbps (internal switch selectable)
- Master port connector: DB25 female
- Slave port connector: 4 each DB9 female
- Size: 4.8"L x 2.8"W x 0.9"H

PARALLAX BASIC Stamps

BASIC Stamps are small computers using a variation of BASIC called PBASIC to control execution of many applications. The BS1-IC has 8 I/O lines, while the BS2-IC has 16 I/O lines which can be connected directly to buttons, LEDs, registers, and many other TTL level devices. Each allows you to store data in the EEPROM before downloading a BASIC program.

Includes: Embedded BASIC plus instruction sets: BASIC interpreter, EEPROM (non-volatile), a resonator and 5V regulator

Flexinol Muscle Wires®

These unique nickel-titanium alloy Muscle Wires® actually shorten in length when electrically powered, and can lift thousands of times their own weight.

- Length: 1 meter

How it works... Pressing the switch lets power flow from the batteries through the Muscle Wire®, heating it and causing it to contract and raise the lever and lift the weight. When power is removed, the Muscle Wire® cools and relaxes, and the weight helps it return to its starting position.

Timer Debounce Kit ● 36-piece kit

Based on the LM555 timer chip, a highly stable device for generating accurate time delays or oscillation. When a switch is turned on or off, mechanical bounce noise generates spurious pulses. When operated in mono-stable mode, the EBTD-9 prevents these noise pulses from adversely affecting your project. Use this circuit to set clocks or counters – any time you need a push-button switch. Or, run the kit in astable mode and learn how clock/timer oscillator circuits work.
